PT Versinia pestis V antigen and Fl antigen or their protection against plague perticipate parts - useful in vaccine for protection against plague PS Disclosure; Page 51-55; 98pp; English.

CC A fusion protein (W01045) comprises the Fl antigen (see also W01042) and V antigen (see also W01041) of Yersinia pestis joined CC by a linker that allows each protein to attain its conformational CC state. It is the product of a gene fusion (T38256) obtd. by PCR CC amplification of Y. pestis DNA. FI/V fusion protein can be CC expressed by gut-colonising organism transformants, to induce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immune—responses in animals. A combined vaccine of V and F1 antigens (see also W01042) can at least match the protection afforded by live attenuated EV76 vaccine without any of the hazards that have kept the EV vaccine from general use. The V antigen is produced using the lcrV gene (see also T38242) obtd. from Y. pestis by PCR amplification. It can also be prepal. as a fusion with F1 antigen (see also W01044-45) and expressed by attenuated AroA or C Salmonella typhi as a live vaccine for long-term protection against plague. Expression by gut-colonising bacterial transformants produces a protective response against Y. pestis.
Recombinant DNA expressing Yersinia pestis V antigen - useful in oral or parenteral vaccines for protection against plague Claim 6; Page 11-13; 25pp; English.
R79961-62 are encoded by T04222-23 (resp.), DNA sequences (lcrV) encoding all or a protective epitopic part of the mature V protein of Yersinia pestis. The protein was expressed as a fusion protein with maltose binding protein or glutathioner-S-transferase in 3 different plasmid vectors. Y. pestis is the highly virulent causative organism of plague in a wide range of animals, including man. The V antigen (LcrV) is an unstable 37.3 kDa monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen is postulated to act as a virulence antigen, and transformed microorganisms contg. recombinant DNA encoding a V antigen protein/peptide are useful in vaccines to protect against plague.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Partial LcrV (V a LcrV; V antigen; Yersinia pestis.

                                                                                                                        resinia pestis V antigen and Fl antigen or their protective epitopic parts - useful in vaccine for protection against plague Disclosure; Page 32-35; 98pp; English.

Yersinia pestis V antigen (W01041) is capable of evoking protective immune responses in animals. A combined vaccine of V and Fl antigens (see also W01042) can at least match the protection afforded by live attenuated EV76 vaccine without any of the hazards that have kept the EV vaccine from general use. The V antigen is produced using the lcrV gene (see also T38243) obtd. from Y. pestis by PCR amplification. It can also be prepd. as a fusion with Fl antigen (see also W01044-45) and expressed by attenuated AroA or C salmonella tymphi and gut-colonising bacteria for protection against

                                                                                                                                                            Š
                                                                                                                                                                                                                                                                PT Recombinant DNA expressing Yersinia pestis V antigen - useful in PT oral or parenteral vaccines for protection against plague
PS Claim 6; Page 15-16; 25pp; English.
CC R79961-62 are encoded by T0422-23 (resp.), DNA sequences (lcrV) encoding CC all or a protective epitopic part of the mature V protein of Yersinia CC pestis. The protein was expressed as a fusion protein with maltose CC binding protein or glutathione-S-transferase in 3 different plasmid CC vectors. Y. pestis is the highly virulent causative organism of plague in a wide range of animals, including man. The V antigen (LcrV) is an CC unstable 37.3 kDa monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen is postulated to act as a virulence antigen, and CC transformed microorganisms contg. recombinant DNA encoding a V antigen protein/peptide are useful in vaccines to protect against plague.
SC Sequence 329 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Qy

The F1 antigen (W01043), including the signal peptide, of Yersini pestis was produced from a DNA sequence (T38248) obtd. by PCR amplification (see also T38257-58) of Y. pestis DNA. Expression of the F1 antigen (see also W01042) by gut-colonising organisms including humans, against plague.

Disclosure; Page 20; 27pp; English.

The sequence represents the Y. pestis caf1 (F1) antigen expressed from plasmid pFORF1b. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection against infection with Y. pestis, and are parenterally and orally active vaccines offering protection
                                                                                                                                                                                                                                                                                                                                                         Protection of animals against plague - using nucleic acid encoding antigen from Yersinia, Pasteurella and Francisella spp.

This is the amino acid sequence of a Yersinia pestis F1 antigen, used in the method of the invention. Plasmid and host cells are used to produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               26-OCT-1998 (first entry)

This is the amino acid sequence of a Yersinia pestis F1 antigen, using the method of the invention. Plasmid and host cells are used the produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable protecting an animal from contracting plague.
                                                                                                                                                                                                                       (HESK-) HESKA CORP.

This is the amino acid sequence of a Yersinia pestis Fl antigen, usin the method of the invention. Plasmid and host cells are used to produce recombinant antigens, especially Yersinia pestis antigens.
                                                                                                                                                                                                                                                                                                                                                                            W01042;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable protecting an animal from contracting plague.

Y Persinia pestis V antigen and Fl antigen or their protective
Y Disclosure; Page 43 45; 98pp; English.
Y Persinia pestis Fl antigen (W01042) is capable of evoking protective
Y Cersinia pestis Fl antigen (W01042) is capable of evoking protective
I antigens (see also W01040-41) can at least match the protection
I cafforded by live attenuated EV76 vaccine without any of the hazards
I that have kept the EV vaccine from general use. The Fl antigen is
I produced using the cafl gene (see also T98244) obtd. from Y.
I can also be prepd. as a fusion with
I v antigen (see also W01044-45) and expressed by attenuated AroA or
I cagainst plague. Expression by gut-colonising bacterial transformants
I can readence a readency v persits.

                                                                                                                                                                                                                                                                                                                                          The sequence represents the Y. pestis cafl (F1) antigen expressed from plasmid proxized. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccine; which induced impune responses at musced as live/attenuated vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bubonic plague; pneumonic plague
Yersinia pestis.

                                                                                                                                                                                                 which induce immune responses at mucosal surfaces. The vacci
provide protection against infection with Y. pestis, and are
parenterally and orally active vaccines offering protection
against bubonic and pneumonic plague.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (MINA ) UK SEC FOR DEFENCE.

Disclosure: Page 18: 27pp; English.

The sequence represents the Y. pestis cafl (F1) antigen expressed from plasmid pFSIG3a. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at tmucosal surfaces. The vaccines provide protection against infection with Y. pestis, and are parenterally and orally active vaccines offering protection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LT 15

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Sat Nov 27 15:37:17 1999; MasPar time 8.24 Seconds 753.590 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Title: >US-08-699-716A-2 (1-521) from US08699716A.pep 3546 1 мGHHHHHHHHHHSSGHIDDD.......RFIQKYDSVMQRLLDDTSGK 521

Scoring table: Sequence: PAM 150 Gap 11

Searched: 122461 seqs, 11912985 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

a-issued 1:5A_COMB 2:5B_COMB 3:PCT9_COMB 4:backfiles1

Statistics: Mean 33.116; Variance 187.062; scale 0.177

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 6; Page 11-13; Z5pp; English.

CC T04222-23 are DNA sequences (lcrV) encoding all or a protective epitopic part of the mature V protein of Versinia pestis. The protein was expressed as a fusion protein with maltose binding protein or capitathione- S-transferase in 3 different plasmid vectors. Y pestis is the highly virulent causative organism of plague in a wide range of animals, including man. The V antigen (LcrV) is an unstable 37.3 kDa monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen is postulated to act as a virulence antigen, and transformed microorganisms contg. recombinant DNA encoding a V antigen protein/ peptide are useful in vaccines to protect against plague.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PT Recombinant DNA expressing Yersinia pestis V antigen - useful in PT oral or parenteral vaccines for protection against plague
PC Claim 6; Page 15-16; 25pp; English.

CC PATC 101 PT DNA sequences (lorv) encoding all or a protective epitopic rolls of the mature V protein of Yersinia pestis. The protein was CC expressed as a fusion protein with maltose binding protein or CC glutathione- S-transferase in 3 different plasmid vectors. Y. pestis is the highly virulent causative organism of plague in a wide range of CC animals, including man. The V antigen (LcrV) is an unstable 37.3 kDa CC monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen CC is postulated to act as a virulence antigen, and transformed CC microorganisms contg. recombinant DNA encoding a V antigen protein/ CC peptide are useful in vaccines to protect against plague.

                                                                                                                                 DNA constructs capable of transforming microorganisms - which can be grainst Yersinia pestis, at mucosal surfaces. Disclosure; Page 19-20; 27pp; English.
The sequence represents the plasmid pFORFIb including the entire Y. pestis cafl (F1) antigen gene having a 5' tail including a SacI (T page 19-20; and up to TATRA downstream of the cafl ORF.
The sequence represents the plasmid pFORFIb including a SacI (T page 19-20; and up to TATRA downstream of the cafl ORF.
The DNA construct can be used to transform human or animal gut (C colonizing microorganisms, specifically attenuated Salmonella (Typhimurium or Salmonella typhi. The transformed microorganisms (C can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection (C against infection with Y. pestis, and are parenterally and orally active vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines offering protection against bubonic and pneumonic (C plague vaccines protection against bubonic and pneumonic (C plague vaccines page vaccines protection against bubonic and pneumonic (C plague vaccines page vaccines page vaccines page vaccines vaccines page vaccines page vaccine

Vaccine; antigen; Salmonella typhimurium;
bubonic plaque; pneumonic plague; pneumonic plague;
DNA constructs capable of transforming microorganisms - which used as live or attenuated vaccines which induce an immune res against Yersinia pestis, at mucosal surfaces. Claim 7; Page 15-16; 27pp; English.

The sequence represents the plasmid pFGAL2a construct showing fusion of the first few bases of beta-galactosidase in the vector that the Y. pestis caf1 (F1) antigen minus its signal sequence having a 5' tail including a SacI restriction site, and up to caf1 AACC-3' end with some vector bases. The DNA construct ca

The vaccines provide protection against infection with Y. pestis, an are parenterally and orally active vaccines offering protection against bubbonic and pneumonic plague.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pisclosure; Page 17-18; 27pp; English.

The sequence represents the plasmid pFSIG3a construct showing the fusion of the first few bases of the E. coli LTB signal sequence with the Y. pestis caf1 (F1) antigen minus its signal sequence and having a 5' tail including a SacI restriction site, and up to the caf1 AACC-3' end with some vector bases. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhinurium or Salmonella typhic The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection against infection with Y. pestis, and are parenterally and orally active vaccines offering protection against bubonic and pneumonic plague.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the produc of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated MPRB of the protein has a mol wt. of 115 kD (calculated MPRB of the protein has a mol wt. of 115 kD (calculated MPRB of the protein for variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

                                                                                                                                                                                                                                           Method for conducting gene therapy - comprises using recombinant gene encoding antibody binding antigen associated with a disease; useful for providing cell immunity.

Example 4; Page 23; 62pp; English.

The sequence given in Q81500 encodes an sFv anti-rev antibody consisting of the variable domains of the heavy and light chains of a mouse MAb against HIV-1 IIIB rev. The sFv specifically binds a highly conserved Rev domain. HeLa 74 cells expressing the SFV were resistant to all HIV-1 Clinical isolates tested.

                                                                                                               Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the produc. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q10572 standard; DNA; 1047

The phisbot process are purified by in Escherichia coli as a soluble protein and was purified by metal chelate affinity chromatography to obtain a product from metal chelate affinity chromatography to obtain a product from the phisbot process are product from the phisbot process.
Random point mutations were introduced into the alpha fragment E.coli beta-galactosidase. The wild type sequence was obtained single stranded template and an oligonucleotide was hybridised it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can amplified and then expressed in a suitable host-vector system.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Random point mutations were introduced into the alpha fragment E.coli beta-galactosidase. The wild type sequence was obtained single stranded template and an oligonucleotide was hybridised it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the

CC Q70467 is a generic DNA sequence used to generate random TSAR (Totally

CC Synthetic Affinity Reagents) peptides. This generic formula can also be

CC represented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)11. X

CC and y are flanking restriction sites (X is not the same as Y) that are

CC ont specific peptides generated by these generic sequences are shown in
